DEOXYURIDINE COMPOUNDS, METHODS FOR PREPARING THEM AND  
THEIR USE IN MEDICINE

This invention relates to certain deoxyuridine compounds which have antiviral activity.

Published European Patent Application No. 0 061 283 discloses esters of 5-(2-halogenovinyl)-2'-deoxyuridines which have antiviral activity selective against herpes viruses.

We have now found a group of mono-, di- and tri-substituted 5-(2-halogenovinyl)-2'-deoxyuridines which have excellent antiviral activity, and which are especially useful in the treatment of infections caused by herpes viruses, such as herpes simplex type 1, herpes simplex type 2 and varicella.

Compounds of formula (I) wherein  $R^1$  or  $R^2$  is optionally substituted  $C_{1-12}$  alkoxy carbonyl, optionally substituted  $C_{3-12}$  alkenyloxy carbonyl, optionally substituted phenoxy carbonyl or optionally substituted phenyl  $C_{1-6}$  alkoxy carbonyl, and  $R^3$  is a hydrogen atom, may be prepared by reacting a compound of formula (III):

in which  $Y$  is as defined in formula (I), with the appropriate alkyl, alkenyl, phenyl or phenylalkyl chloroformate.

The reaction is suitably carried out in an anhydrous organic solvent in the presence of a base, preferably at depressed or room temperature, and the product purified chromatographically by, for example, column chromatography on silica gel.

Examples of suitable solvent systems for carrying out the reaction are anhydrous pyridine, tetrahydrofuran/sodium carbonate, and tetrahydrofuran/triethylamine.

The reaction will generally produce a mixture of products wherein both of  $R^1$  and  $R^2$  are alkoxy-, alkenyloxy-, phenoxy- or phenylalkoxy-carbonyl groups, and each of  $R^1$  and  $R^2$  is a hydrogen atom while the

other is alkoxy-, alkenyloxy-, phenoxy- or phenylalkoxy-carbonyl. The mixture can be separated into its pure components by chromatographic methods. The relative amounts of products will depend on the relative amounts of reactants, the physical conditions of the reaction, and the solvent system. For example, an excess of chloroformate will produce more of the disubstituted compound in the final mixture.

Compounds of formula (I) wherein  $R^3$  is alkoxy-, alkenyloxy-, phenoxy- or phenylalkoxy-carbonyl as defined above, and  $R^1$  and  $R^2$  are each hydrogen atoms, may be prepared by treating a compound of formula (IV):

wherein Y is as defined in formula (I), and  $Q^1$  and  $Q^2$  are O-protecting groups, with the appropriate alkyl, alkenyl, phenyl- or phenylalkyl-chloroformate, and deprotecting the resultant product.

Suitable O-protecting groups are trialkylsilyl groups, such as trimethylsilyl.

The reaction is suitably carried out in an anhydrous organic solvent in the presence of a base, preferably at room temperature, and the product may be purified by column chromatography on silica gel.

The compound of formula (IV) may be prepared by treating a compound of formula (III) as defined above, with a silylating agent.

Suitable silylating agents include halosilanes or silazanes of the formulae:

$L_3 Si U$ ;  $L_3 Si NL_2$ ;  
 $L_3 Si NH Si L_3$ ;  $L_3 Si.NH.COL$ ;  $L_3 Si.NH.CO.NH.Si L_3$ ;  
 $L NH.CO.NH.Si L_3$ ;  $L_3 Si N = CLO Si L_3$ .

wherein U is a halogen and the various groups L which may be the same or different, each represents hydrogen or alkyl, aryl or aralkyl.

A preferred silylating agent is N,O-bis(trimethylsilyl)acetamide, and the silylation reaction is preferably carried out in an anhydrous organic solvent, suitably tetrahydrofuran, at room temperature.

The product may be purified chromatographically by, for example, column chromatography on silica gel.

The protected compound of formula (IV), wherein  $Q^1$  is replaced by a hydrogen atom, may also be used to prepare compounds of formula (I), wherein  $R^2$  is alkoxy-, alkenyloxy-, phenoxy- or phenylalkoxy-carbonyl and  $R^1$  and  $R^3$  are each hydrogen atoms, by treatment with an alkyl-, alkenyl-, phenyl- or phenylalkyl-chloroformate and deprotecting the resultant product. The reaction conditions are similar to those described above.

Compounds of formula (I) wherein  $R^1$ ,  $R^2$  or  $R^3$  is an acyl group as defined, may be prepared by treating the compounds of formula (I) wherein  $R^1$ ,  $R^2$  or  $R^3$  is a hydrogen atom, with an acylating agent containing the  $X - \overset{\overset{\text{O}}{\parallel}}{\text{C}} -$  group or  $-Z - \overset{\overset{\text{O}}{\parallel}}{\text{C}} -$  group, wherein

X and Z are as defined with respect to formula (I).

A preferred acylating agent is an acid anhydride

or an acid chloride of formula  $X - \overset{\overset{\text{O}}{\parallel}}{\text{C}} - \text{Cl}$

The reaction is conveniently carried out in an anhydrous organic solvent such as tetrahydrofuran in the presence of a base or pyridine, and the product purified by column chromatography on silica gel.

In the case where, in the reactant of formula (I),  $R^1$  is alkoxy-, alkenyloxy-, phenoxy- or phenylalkoxy-carbonyl, and  $R^2$  and  $R^3$  are both hydrogen atoms, the reaction will generally produce a mixture of three products, wherein each one of the two hydrogen atoms is replaced by an acyl group while the other hydrogen atom remain intact, and wherein both hydrogen atoms are replaced by acyl groups.

The mixture can be separated into its pure components by chromatographic methods. In order to prepare compounds of formula (I) wherein two of  $R^1$ ,  $R^2$  and  $R^3$  are different acyl groups, the mono-acylated compounds prepared as described above may be isolated from the three product mixture and further treated with a different acylating agent under similar reaction conditions. In this way, any combination of acylated derivatives may be prepared, as required.

Certain compounds of formula (I) can themselves be converted to other compounds of formula (I).

For example, compounds of formula (I) in which  $R^1$  is optionally substituted phenoxy carbonyl may be converted into compounds wherein  $R^1$  is  $C_{1-12}$  alkoxy carbonyl by treatment with a  $C_{1-12}$  alkanol, preferably in the presence of a basic organic solvent such as pyridine. In a similar manner, treatment with a  $C_{2-12}$  diol, in place of the  $C_{1-12}$  alkanol, will yield a compound of formula (I) wherein  $R^1$  is hydroxy substituted  $C_{2-12}$  alkoxy carbonyl.

Phosphate esters of the compounds of formula (I) may be prepared by treating a compound of formula (I), in which  $R^1$  or  $R^2$  is hydrogen, with phosphoryl chloride, preferably in an anhydrous basic organic solvent such as pyridine. The ester can be suitably prepared in the form of an alkali metal salt by the addition of an alkali metal bicarbonate to the ester.

The compounds of formula (I) or salts or esters thereof may be formulated for use in a pharmaceutical composition. Accordingly, in a further aspect of the invention, there is provided a pharmaceutical composition which comprises a compound of the formula (I) or a pharmaceutically acceptable salt or ester thereof, together with a pharmaceutically acceptable carrier or excipient.

Compositions which may be administered by the oral route to humans may be compounded in the form of syrups, tablets and capsules. When the composition is in the form of a tablet, any pharmaceutical carrier suitable for formulating such solid compositions may be used, for example magnesium stearate, starch, lactose,

glucose, rice, flour and chalk. The composition may also be in the form of an ingestible capsule, for example of gelatin, to contain the compound, or in the form of a syrup, a solution or a suspension. Suitable liquid pharmaceutical carriers include ethyl alcohol, glycerine, saline and water to which flavouring or colouring agents may be added to form syrups. The compounds may also be presented with a sterile liquid carrier for injection.

The composition may also be formulated for topical application to the skin or eyes.

For topical application to the skin, the compounds of the invention may be made up into a cream, lotion or ointment. These formulations may be conventional formulations well known in the art, for example, as described in standard books of pharmaceuticals and cosmetics, such as Harry's Cosmetology published by Leonard Hill Books and the British Pharmacopoeia.

The composition for application to the eyes may be a conventional eye-drop composition well known in the art.

Preferably, the compositions of this invention are in unit dosage form or in some other form that the patient may administer to himself a single dose. A suitable dosage unit might contain from 50 mg to 1 g of active ingredient, for example 100 to 500 mg. Such doses may be administered 1 to 4 times a day or more usually 2 or 3 times a day. The effective dose of compound depends on the particular compound employed, but is in general in the range of from 1.0 to 20 mg/kg of body weight per day or more usually 2.0 to 10 mg/kg per day.

0095294

In a further aspect of the invention there is provided a method of treating viral infections in human and non-human animals, which comprises administering to the sufferer an effective amount of a compound of formula (I) or a pharmaceutically acceptable salt or ester thereof.

Method

Vero (African Green Monkey Kidney) cells were grown to confluence in 24 well multidishes, each well being 1.6cm in diameter. The cells were infected with Herpes simplex type 1 virus (HFEM strain) and overlaid with 0.5ml of 0.9% agarose (w/v) in maintenance medium. Test compounds prepared in maintenance medium in concentrations ranging from 100 to 0.03µg/ml in half-log dilution steps, were added in 0.5ml volume. The virus infected cultures were then incubated at 37° for 4 days before fixing in 4% formaldehyde solution and staining with carbol-fuchsin. The dishes were then examined to find what concentration of test compound caused a 50% reduction in the number of virus plaques formed (PDD<sub>50</sub> value) and the minimum concentration of test compound which caused cytotoxicity (MTD).
